Google Cloud H2S

AI Builder Cup

Build in JAPAC.
Build for the world.

Project Loop

Evidence-backed next steps, approved by people

Team name: Project Loop

Team leader: Daniel Tan YI Tern

Problem: project updates scatter across tools; follow-up work loses its owner, context, and evidence trail.

A clear path from update to action

PROJECT LOOP / FUTURE OF WORK

The problem

Teams record findings and decisions,
but the next action gets lost.
Generic summaries may invent progress.

The idea

Gemini proposes next steps from dated updates. Each task cites exact evidence.
A person approves before it is saved.

One workflow: LOG -> ANALYZE -> REVIEW -> ACT

Why Project Loop is different

PROJECT LOOP / FUTURE OF WORK

Traceable

Every suggestion must cite an existing update ID. Unknown IDs are rejected.

Human controlled

AI output stays a draft. Only explicit approval creates a task.

Focused

A safe public slice of a working personal dashboard; no private data or tools.

Built for small teams that need accountable follow-through.

Features in the working prototype

PROJECT LOOP / FUTURE OF WORK

01 Project evidence

Browse three sample projects and dated updates; add a fictional finding.

02 Gemini brief

Summarize the selected project and suggest follow-up work.

03 Verified citations

The server checks cited IDs against the selected project evidence.

04 Human approval

Review a draft, approve a task, then see it persist on the board.

Process flow

PROJECT LOOP / FUTURE OF WORK

1 LOG

Add a dated project update

>

2 ANALYZE

Gemini creates a draft brief

>

3 VERIFY

Server validates evidence IDs

>

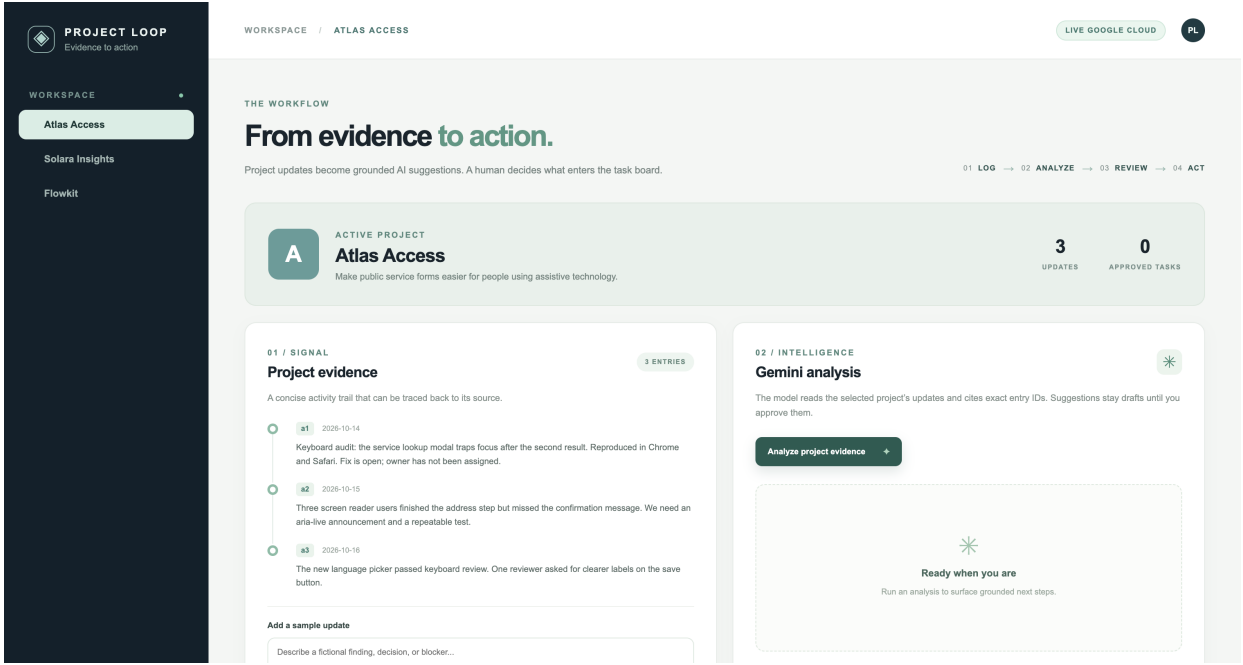

4 APPROVE

Person saves one task

The task retains its source IDs and remains visible after refresh.

Interface wireframe

LIVE CLOUD UI / SYNTHETIC DATA

Evidence

Dated entries with short source IDs.

Decision

Gemini drafts; a person approves.

Google Cloud architecture

PROJECT LOOP / FUTURE OF WORK

Browser

Sample projects and human review

>

Firebase Hosting

Public HTTPS entry point

>

Cloud Run

Node API and citation validation

>

Vertex AI

Gemini 2.5 Flash

Firestore

Session state

Only synthetic demo data. No file-system, diary, Git, or private credentials.

Technologies and responsibility

PROJECT LOOP / FUTURE OF WORK

Google services

Firebase Hosting: public web entry
Cloud Run: API and static UI
Firestore: isolated demo sessions
Vertex AI: Gemini analysis

Safety checks

Server-side model call; no browser key
Exact-ID citation validation
Bounded input and analysis quotas
Human approval before task creation

Runtime: Node.js 22 | Source: public GitHub branch

Cost approach

OPTIONAL TEMPLATE SECTION

Usage-based components

Cloud Run requests and compute
Firestore reads and writes
Vertex AI Gemini tokens
Firebase Hosting delivery

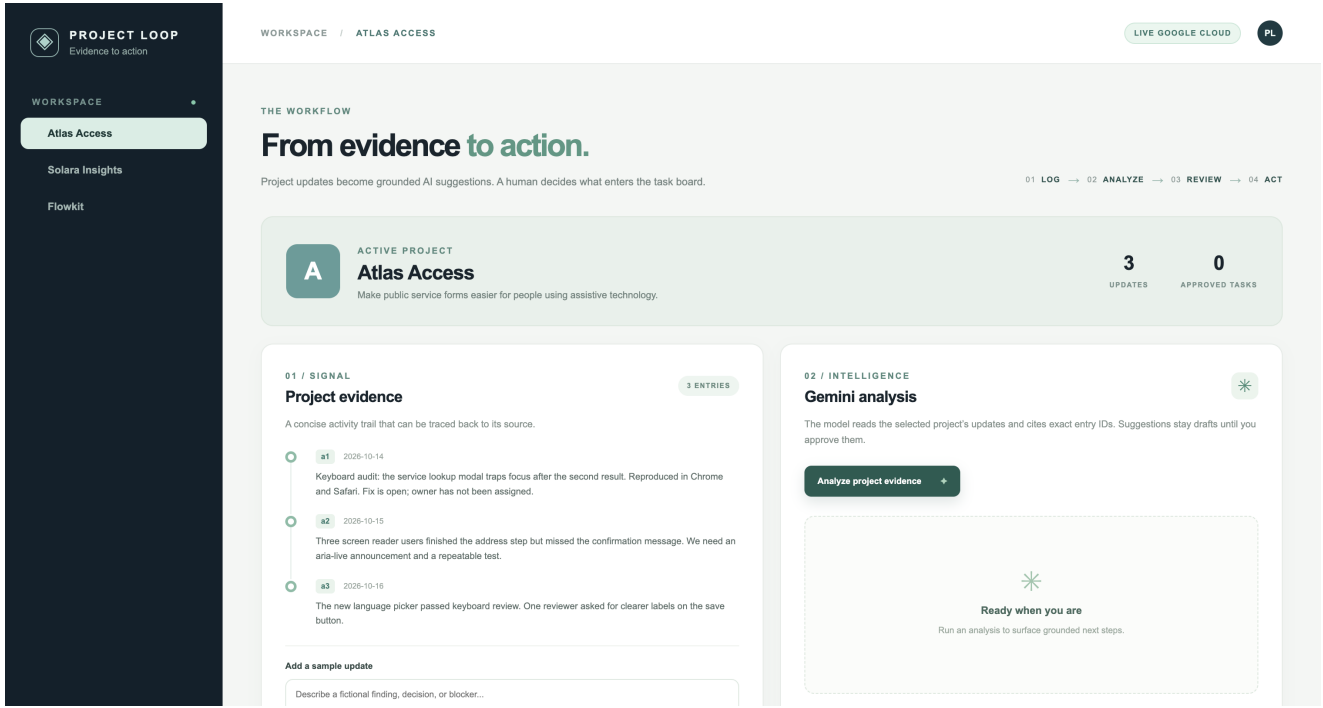

Prototype controls

Five analyses per demo session
Eight updates max sent to Gemini
Set Cloud Run instance and budget caps
Review spend in Cloud Billing

No estimated spend is claimed before a live deployment is measured.

Prototype snapshot

LIVE FIREBASE HOSTING + CLOUD RUN

Verification and benchmark plan

PROJECT LOOP / FUTURE OF WORK

Verified locally

Automated evidence and approval tests pass
Draft -> approval -> task UI smoke-tested
No private dashboard data included

Verified on public URL

Firebase Hosting and Cloud Run respond
Gemini returned 3 grounded suggestions
Task and update persisted after refresh
Latency/cost baseline: future measurement

We do not claim cloud latency or benchmark numbers before measuring them.

Future development

PROJECT LOOP / FUTURE OF WORK

Team identity

Account sign-in and shared project roles after the prototype.

More sources

Import approved project documents with provenance.

Measurement

Compare time to review against the current workflow.

Keep a human decision at the point where a suggestion becomes work.

Submission links

PUBLIC LINKS / KEEP AVAILABLE DURING EVALUATION

Deliverables

Public source: github.com/edent95/project-loop-aibuildercup-2026

3-4 minute working demo: project-loop-aibc26-eden.web.app/demo.mp4

Live prototype: project-loop-aibc26-eden.web.app

The live URLs must remain available throughout evaluation.
